VI. Annexe : objets et mots-clés Microsoft Scripting.....54

VII. Annexe : les classes Wmi56

Denis Szalkowski <http://www.dsfc.net>

I. Le langage Vbscript

A. Constantes et variables

1. Tester les variables

IsArray()
 IsDate()
 IsEmpty()
 IsError()
 IsNull()
 IsNumeric()
 IsObject()

B. Les fonctions

1. Chaînes

LCase(), UCase()
 Left(), Right(),Mid(),InStr(), Len()

2. Dates / Heures

Date(), Time(), DateAdd(),DateDiff(),Day(), Month(), Year(),Hour(), Minute(), Second(),WeekdayName(), MonthName()

C. Instructions d'interaction

1. MsgBox

a) Syntaxe

MsgBox("Message", Boutons, "Titre")

b) Boutons

vbOKOnly	0
VbOKCancel	1
VbAbortRetryIgnore	2
VbYesNoCancel	3
VbYesNo	4
VbRetryCancel	5
vbCritical	16
VbQuestion	32
VbExclamation	48
VbInformation	64

2. InputBox

D. Les structures de contrôle

1. Les instructions conditionnelles

a) If

```
If Condition Then
...
End If
If Condition Then
...
Else
...
End If
If Condition1 Then
```

```
...  
Elseif Condition2 Then  
...  
End If
```

b) Select

```
Select Case Expression  
Case Valeur1  
...  
Case Valeur2  
...  
Case Else  
...  
End Select
```

2. Les boucles

a) For

```
For Compteur = Début To Fin Step Pas  
...  
Next Compteur
```

b) While

```
While condition  
...  
Wend
```

c) Do... Loop

```
Do While|Until Condition  
...  
Loop  
Do  
...  
Loop While|Until Condition
```

E. La gestion d'erreur

```
On Error Resume Next  
If Err.Number<>0 Then  
...  
End If
```

F. Utilisation d'éditeurs

AderSoft VbsEdit 2.0
Sapien Primal Script 3.1.438 (The Best)

II. Les objets Wsh

A. Présentation

WSH Windows Scripting Host
Technologie fondée sur ActiveX
Langage interprété

B. Composants

L'utilisation de ce langage nécessite le chargement de plusieurs composants :

Vbscript.dll	vscript
Jscript.dll	jscript
wshcon.dll	Windows Script Controller
wshext.dll	Shell Extension for Windows Script Host
wshfr.dll	Ressources internationales de Windows Script Host
wshom.ocx	Windows Script Host Runtime Library

Ces technologies sont très "dangereuses". Elles supposent d'être employées dans le cadre d'un réseau parfaitement sécurisé et de l'utilisation d'un navigateur autre que Internet Explorer qui permet l'utilisation de ces technologies dans le cadre d'Internet.

Pour activer ces technologies:

```
@echo off
cls
rem
rem L'objet de ce batch est d'inscrire les DLL nécessaires à l'exécution des
scripts Wsh
rem
set WIN=%systemroot%\system32
rem
rem Microsoft (r) Windows Script Controller
rem
%win%\regsvr32.exe -s %WIN%\wshcon.dll
rem
rem Microsoft (r) Shell Extension for Windows Script Host
rem
%win%\regsvr32.exe -s %WIN%\wshext.dll
rem
rem Ressources internationales de Microsoft (r) Windows Script Host
rem
%win%\regsvr32.exe -s %WIN%\wshfr.dll
rem
rem Windows Script Host Runtime Library
rem
%win%\regsvr32.exe -s %WIN%\wshom.ocx
rem
rem Microsoft (r) VBScript
rem
%win%\regsvr32.exe -s %WIN%\vbscript.dll
rem
rem Microsoft (r) JScript
rem
%win%\regsvr32.exe -s %WIN%\jscript.dll
rem
rem Microsoft (r) VBScript - Ressources internationales
rem
%win%\regsvr32.exe -s %WIN%\vbsfr.dll
SET WIN=
```

Pour désactiver ces technologies, utilisez regsvr32.exe -u -s.

C. Mode d'exécution

1. Les pages Wsf

Ce fichier peut être tapé dans le bloc note. Pensez à le sauvegarder avec l'extension .wsf.

Pour l'exécuter, tapez wscript //job:1 wsf.wsf

<package>

```
<comment>
  Mon commentaire
</comment>
<job id="1">
  <object id="O_SHELL" progid="Wscript.shell" />
  <reference object="Wscript.Shell"/>
  <resource id="LOGICIEL">Votre logiciel</resource>
  <resource id="CHOIX"></resource>
  <script language="vbscript">
    CHOIX=InputBox(GetResource("LOGICIEL"),"Votre choix")
    O_SHELL.Run CHOIX
  </script>
</job>
</package>
```

2. Les pages Html

```
<html>
<body>
<script language="vbscript">
  Option Explicit
  Dim NETWORK,USER,COMPUTER
  Set NETWORK=CreateObject("WScript.NETWORK")
  With NETWORK
    USER=.UserName : COMPUTER=.ComputerName
  End With
  document.Write USER & "," & COMPUTER
  Set USER=Nothing
  Set COMPUTER=Nothing
  Set NETWORK=Nothing
</script>
</body>
</html>
```

D. Utilisation de Jscript

```
<html>

<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1">
</head>

<body >
<script language="javascript">
  for(prop in navigator)
  {
    document.write('navigator.'+prop+'='+navigator[prop]+'<br>');
  }
  if(navigator.appName!='Microsoft Internet Explorer')
  {
    location.href='http://www.alltheweb.com';
  }
</script>
<script language="jscript">
  var e=new Error("0","Pas d'erreur");
  try
  {
    var OBJ_WSH_NETWORK=new ActiveXObject("Wscript.Network");
  }
  catch(e)
  {
```

```

        document.write('Erreur : ' + e.number + ' ' + e.description + '<br>')
    }
    if(e.number==0)
    {
        with(OBJ_WSH_NETWORK)
        {
            document.write("En jscript : " + ComputerName + " " + UserName + "<br>");
        }
    }
    else
    {
        //location.href='http://www.alltheweb.com!';
    }
</script>
<script language="vbscript">
    On Error Resume Next
    Set OBJ_WSH_NETWORK=CreateObject("Wscript.Network")
    If Err.number=0 then
        With OBJ_WSH_NETWORK
            document.write "En vbscript : " & .ComputerName & " " & .UserName & "<br>"
        End With
    Else
        With Err
            document.write "Erreur : " & .number & " " & .description & "<br>"
        End With
    End If
    location.href="http://www.alltheweb.com"
</script>
</body>

</html>

```

E. Utilisation d'un fichier hta

```

<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1">
<HTA:APPLICATION
    application="Vive le"
    border="dialog"
    borderStyle="normal"
    caption="yes"
    icon=""
    maximizeButton="yes"
    minimizeButton="yes"
    showInTaskbar="no"
    systemMenu="yes"
    windowState="normal"
    innerBorder="yes"
    navigable="yes"
    scroll="auto"
    selection="no"
    scrollFlat="yes"
/>
</head>
<body>
<script language="vbscript">
    Document.Write "<b>Attention : l'utilisation de Windows peut nuire !!!</b><br><br>"
    'Set WSH=CreateObject("WScript.Shell")
    'With WSH

```

```

    .RegWrite "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows
NT\CurrentVersion\RegisteredOrganization", "Sherlok Holmes", "REG_SZ"
    .RegWrite "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows
NT\CurrentVersion\RegisteredOwner", "Sherlok Holmes", "REG_SZ"
End With
Set FSO=CreateObject("Scripting.FileSystemObject")
Set F=FSO.OpenTextFile("c:\boot.ini", 1)
Do
    document.write F.ReadLine & "<br>"
Loop Until F.AtEndOfStream
Set F=Nothing
Set FSO=Nothing
Set WSH=Nothing
</script>
</body>
</html>

```

F. Shell

1. Méthodes

BrowseForFolder	Recherche d'un dossier
CascadeWindows	Afficher les fenêtres en cascade
ControlPanelItem	Composants du panneau de configuration
EjectPC	Ejecte le PC de son support
Explore	Ouvrir le dossier
FileRun	Boîte de dialogue Exécuter
FindComputer	Recherche d'ordinateurs
FindFiles	Recherche de fichiers
Help	Affiche l'aide
MinimizeAll	Tout réduire
NameSpace	Ouvrir un dossier spécial
Open	Ouvrir un dossier
RefreshMenu	Actualiser le menu
SetTime	Propriétés Date et heure
ShutdownWindows	Quitter Windows
SubHelp	Afficher l'aide
Suspend	Fonction suspendre
TileHorizontally	Réorganiser horizontalement
TileVertically	Réorganiser verticalement
TrayProperties	Propriétés de la barre de tâches
UndoMinimizeAll	Annulation de la réduction de toutes les fenêtres
Windows	Ferme toutes les fenêtres ouvertes

2. Pour fonctionner...

Vous devez disposer de la version [Version 4.71](http://www.dsfc.net) ou supérieure de Shell32.dll

3. Exemple

```

Set ObjAppli=CreateObject("Shell.Application")
objAppli.SetTime

```

G. Objet Wscript

1. Propriétés et méthodes

Propriété	Description
Application	Retourne l'interface IDispatch pour Wscript
Arguments	Collection des paramètres
ConnectObject	Connecte les événements d'un objet à des fonctions avec un

Propriété	Description
	préfixe donné.
CreateObject	Crée un objet et met en place la gestion des événements.
DisconnectObject	Déconnecte un objet précédemment connecté de WSH.
Echo	Affiche des paramètres dans une fenêtre ou au prompt d'une commande dans la fenêtre DOS.
FullName	Chemin complet de l'exécutable utilisé
GetObject	Retourne un objet Automation à partir d'un fichier.
Name	Nom de wscript (propriété par défaut)
Path	Nom du répertoire où se trouvent Wscript.exe ou Cscript.exe
Quit	Stoppe l'exécution avec un code d'erreur particulier.
Read (avec <i>strStream</i> représentant une propriété stdIn)	Lie un nombre spécifié de caractères dans un flux d'entrée et renvoie la chaîne résultante.
ReadAll (avec <i>strStream</i> représentant une propriété stdIn)	Lie un flux d'entrée et renvoie la chaîne résultante.
ReadLine (avec <i>strStream</i> représentant une propriété stdIn)	Lie une ligne d'un flux d'entrée et renvoie la chaîne résultante.
ScriptFullName	Chemin complet du script qui est exécuté par WSH
ScriptName	Nom du fichier de script qui est exécuté par WSH
Skip (avec <i>strStream</i> représentant une propriété stdIn)	Ignore un certain nombre de caractères lors de la lecture d'un flux de données entrant (« input stream »).
SkipLine (avec <i>strStream</i> représentant une propriété stdIn)	Ignore la ligne suivante lors de la lecture d'un flux de données entrant (« input stream »).
Sleep	Place le process dans un état inactif pour un nombre spécifié de millisecondes et continue ensuite l'exécution.
StdErr	Expose le flux de sortie en écriture seule concernant l'erreur (terme US : write-only error output stream) pour le script courant.
StdIn	Expose le flux d'entrée en lecture seule (terme US : read-only input stream) pour le script courant.
StdOut	Expose le flux de sortie en écriture seule (terme US : a write-only output stream) pour le script courant.
strStream.AtEndOfLine (avec <i>strStream</i> représentant une propriété stdIn)	Renvoie True si le pointeur d'entrée précède juste l'indicateur de fin de ligne dans un flux d'entrée
strStream.AtEndOfStream (avec <i>strStream</i> représentant une propriété stdIn)	Renvoie True si le pointeur d'entrée est à la fin du flux d'entrée
<i>strStream</i> .Close (avec <i>strStream</i> représentant une propriété stdIn, stdOut, stdErr)	Ferme un flux ouvert
strStream.Column (avec <i>strStream</i> représentant une propriété stdIn)	Renvoie le numéro de colonne de la position du caractère courant dans le flux d'entrée
Version	Version de WSH
Write (avec <i>strStream</i> représentant une propriété stdOut ou stdErr)	Ecrit une chaîne spécifiée dans un flux de données sortant (« output stream »).
WriteBlankLines (avec <i>strStream</i> représentant une propriété stdOut ou stdErr)	Ecrit un certain nombre de nouvelles lignes de caractères dans un flux de données sortant (« output stream »).
WriteLine (avec <i>strStream</i> représentant une propriété stdOut ou stdErr)	Ecrit une ligne spécifiée et un caractère newline dans un flux de données sortant (« output stream »).

2. Exemple : Arguments, Echo, Quit

```
Set OBJ_ARG = Wscript.Arguments
For Each ARG in OBJ_ARG
    AFFICHE=AFFICHE & Chr(13) & ARG
Next
With Wscript
    .Echo AFFICHE
End With
```

.Quit
End With

H. Objet Wscript.Shell

1. Méthodes et propriétés

Méthode	Description

TMP	Autre variable des fichiers temporaires	-	X	X	X																																																																																																								

2. Exemples

a) premier exemple : activate, sleep, sendkeys

```
set WshShell = WScript.CreateObject("WScript.Shell")
WshShell.Run "calc"
WScript.Sleep 100
WshShell.AppActivate "Calculator"
WScript.Sleep 100
```

```

WshShell.SendKeys "1{+}"
WScript.Sleep 500
WshShell.SendKeys "2"
WScript.Sleep 500
WshShell.SendKeys "~"
WScript.Sleep 500
WshShell.SendKeys "*3"
WScript.Sleep 500
WshShell.SendKeys "~"
WScript.Sleep 2500

```

b) 2ème exemple : CreateShortcut

```

set WshShell = WScript.CreateObject("WScript.Shell")
Set WSHSHELL=Wscript.CreateObject("WScript.Shell")
CHEMIN_BUREAU = WSHSHELL.SpecialFolders("Desktop")
Set RACCOURCI_CALC = WSHSHELL.CreateShortcut(CHEMIN_BUREAU & "\Calculatrice.lnk")
With RACCOURCI_CALC
    .TargetPath = WScript.ScriptFullName
    .WindowStyle = 1
    .Hotkey = "CTRL+SHIFT+C"
    .IconLocation = "calc.exe, 0"
    .Description = "Calculatrice"
    .WorkingDirectory = CHEMIN_BUREAU
    .Save
End With
Set LIEN_GOOGLE = WshShell.CreateShortcut(CHEMIN_BUREAU & "Google.url")
With LIEN_GOOGLE
    .TargetPath = "http://www.google.fr"
    .Save
End With

```

3. 3ème exemple : ExpandEnvironmentStrings

```

set WshShell = WScript.CreateObject("WScript.Shell")
WScript.Echo "WinDir is " & WshShell.ExpandEnvironmentStrings("%WinDir%")

```

4. 4ème exemple : RegRead, RegWrite

```

Set WSHSHELL=Wscript.CreateObject("Wscript.Shell")
On Error Resume Next
TEXTE_CLE_CALC="HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Run\Calculatrice"
CLE_CALC=WSHHELL.RegRead(TEXTE_CLE_CALC)
If CLE_CALC = "" Then
    WSHSHELL.RegWrite TEXTE_CLE_CALC,"c:\windows\calc.exe","REG_SZ"
    Wscript.Echo "Entrée ajoutée !"
Else
    Wscript.Echo "La clé existe déjà !"
End If

```

5. Exemple 5 : Run

```

'Ouvre le fichier boot.ini
Set OBJ_WSH_SHELL=CreateObject("Wscript.Shell")
OBJ_WSH_SHELL.Run("notepad.exe c:\boot.ini")
' OBJ_WSH_SHELL.Run("c:\boot.ini")

```

6. Exemple 6 : Popup

```

'Utilisation de Popup qui remplace MsgBox de Vb
Set OBJ_WSH_SHELL=CreateObject("Wscript.Shell")
V_REPONSE=OBJ_WSH_SHELL.Popup("Votre texte ici",120,"Votre texte là",0)

```

With Wscript

```
Select Case V_REPONSE
```

```
Case 6:
```

```
.echo "Vous avez répondu oui"
```

```
Case 7:
```

```
.echo "Vous avez répondu non"
```

```
End Select
```

```
.quit
```

```
End With
```

I. *Objet Wscript.Environment*

Cette manipulation se fait à partir de l'objet objShell défini précédemment. La propriété Environment de cet objet permet de récupérer les variables d'environnement sous forme d'une collection. La méthode Environment peut prendre en argument une des valeurs suivantes : « USER », « SYSTEM » et « PROCESS ». Ces valeurs seront dépendantes soit de l'utilisateur, soit du système, soit du process en cours.

Si aucune valeur n'est fournie, la valeur utilisée sera « SYSTEM » sur WindowsNT et « PROCESS » sur Windows95. Sur Windows95, « PROCESS » est d'ailleurs la seule valeur supportée.

Dans la documentation, la variable « WshEnvironnement » est souvent utilisée pour désigner cette collection, mais on peut appeler cette collection différemment. Il ne s'agit pas d'un objet intrinsèque.

1. Propriétés et méthodes

Item
Length
Count
Remove

2. Exemples

a) Exemple 1

```
Set WSHSHELL = WScript.CreateObject("WScript.Shell")
```

```
Set WSHENV = WshShell.Environment("PROCESS")
```

```
Wscript.Echo WSHENV.Length
```

```
Wscript.Echo WSHENV.Count
```

```
For Each VAR_ENV in WSHENV
```

```
    AFFICHE=AFFICHE & Chr(13) & VAR_ENV
```

```
Next
```

```
Wscript.Echo AFFICHE
```

b) Exemple 2

```
Set shell = WScript.CreateObject("WScript.Shell")
```

```
WScript.Echo shell.Environment("PROCESS").Item("WINDIR")
```

```
WScript.Echo shell.Environment("PROCESS").Item("PATH")
```

```
WScript.Echo shell.Environment("PROCESS").Item("PROMPT")
```

```
WScript.Echo shell.ExpandEnvironmentStrings("PROCESS").("%WINDIR%")
```

```
shell.Environment.Remove("PATH")
```

```
Wscript.Echo shell.ExpandEnvironmentStrings( _
```

```
"The Windows directory is: %WINDIR%")
```

J. *objet Wscript.Network*

1. Propriétés et méthodes

a) AddWindowsPrinterConnection

(1) *Intérêt*

Ajoute une imprimante

(2) *Syntaxe*

Windows NT/2000 `object.AddWindowsPrinterConnection(strPrinterPath)`
 Windows 9x/Me `object.AddWindowsPrinterConnection(strPrinterPath,strDriverName[,strPort])`

(3) Arguments

`strPrinterPath` Chemin UNC désignant l'imprimante
`strDriverName` Nom du pilote (inutile sous Windows NT/2000)
`strPort` Port utilisé (inutile sous Windows NT/2000)

(4) Exemples

```
Set WshNetwork = WScript.CreateObject("WScript.Network")
PrinterPath = "\\printserv\DefaultPrinter"
WshNetwork.AddWindowsPrinterConnection PrinterPath
Set WshNetwork = WScript.CreateObject("WScript.Network")
PrinterPath = "\\printserv\DefaultPrinter"
PrinterDriver = "Lexmark Optra S 1650"
WshNetwork.AddWindowsPrinterConnection PrinterPath, PrinterDriver
```

b) EnumPrinterConnections*(1) Syntaxe*

objPrinters = *object.EnumPrinterConnections*

(2) Arguments

objPrinters Contient les informations de connexion

(3) Exemple

```
Set WshNetwork = WScript.CreateObject("WScript.Network")
Set oPrinters = WshNetwork.EnumPrinterConnections
AFFICHE= "Système local d'impression"
For i = 0 to oPrinters.Count - 1 Step 2
  AFFICHE=AFFICHE & Chr(13) & "Port " & oPrinters.Item(i) & " = " & oPrinters.Item(i+1)
Next
WScript.Echo AFFICHE
```

c) RemovePrinterConnection*(1) Intérêt*

Retire une imprimante partagée

(2) Syntaxe

`object.RemovePrinterConnection(strName, [bForce], [bUpdateProfile])`

(3) Arguments

`strName` Supprime un port de type UNC ou un port local (LPT1)
`bForce` Valeur logique qui force la suppression alors des utilisateurs sont connectés
`bUpdateProfile` Si la valeur est à True, les modifications sont apportées au profil de l'utilisateur. La valeur par défaut est False.

(4) Exemple

```
Set WshNetwork = WScript.CreateObject("WScript.Network")
Set PrinterPath = "\\printserv\DefaultPrinter"
Set PrinterDriver = "Lexmark Optra S 1650"
On Error Resume Next
WshNetwork.AddWindowsPrinterConnection(PrinterPath, PrinterDriver)
If Err.Number <> 0 then
  WScript.Echo("Printer Connection Failed!")
```

```
End If
WshNetwork.RemovePrinterConnection (PrinterPath, true, true)
AddPrinterConnection
```

d) AddPrinterConnection

(1) Intérêt

Ajoute un port d'impression MS-DOS

(2) Syntaxe

```
object.AddPrinterConnection(strLocalName, strRemoteName[,bUpdateProfile][,strUser][,strPassword])
```

(3) Arguments

strLocalName Nom du port local assigné à l'imprimante distante
strRemoteName Nom de l'imprimante distante (chemin UNC)
bUpdateProfile True permet la mise à jour du profil de l'utilisateur
strUser Nom de l'utilisateur
strPassword Mot de passe

(4) Exemple

```
Set WshNetwork = WScript.CreateObject("WScript.Network")
WshNetwork.AddPrinterConnection "LPT1", "\\
```

e) SetDefaultPrinter

(1) Intérêt

Définit l'imprimante par défaut

(2) Syntaxe

```
object.SetDefaultPrinter(strPrinterName)
```

(3) Arguments

strPrinterName Imprimante distante en dénomination UNC

(4) Exemple

```
Set WshNetwork = WScript.CreateObject("WScript.Network")
Set PrinterPath = "\\research\library1"
Set rc = WshNetwork.AddWindowsPrinterConnection(PrinterPath)
If Not rc then
    WScript.Echo("Printer Connection Failed!")
End If
WshNetwork.SetDefaultPrinter PrinterPath
```

Returns the current network drive mapping information.

f) EnumNetworkDrives

(1) Intérêt

Liste les lecteurs mappés

(2) Syntaxe

```
objDrives = object.EnumNetworkDrivesArguments
```

(3) Argument

objDrives Variable qui stocke les valeurs des lecteurs mappés

(4) Exemple

```

Set WshNetwork = WScript.CreateObject("WScript.Network")
Set oDrives = WshNetwork.EnumNetworkDrives
AFFICHE="Lecteurs réseaux:"
For i = 0 to oDrives.Count - 1 Step 2
    AFFICHE=AFFICHE & Chr(13) & "Lecteur" & oDrives.Item(i) & " = " & oDrives.Item(i+1)
Next
WScript.Echo AFFICHE

```

g) MapNetWorkDrive*(1) Syntaxe*

```
object.MapNetworkDrive(strLocalName, strRemoteName, [bUpdateProfile], [strUser], [strPassword])
```

(2) Arguments

strLocalName	Nom du port lecteur logique assigné au chemin UNC
strRemoteName	Chemin UNC du répertoire partagé
bUpdateProfile	True permet la mise à jour du profil de l'utilisateur
strUser	Nom de l'utilisateur
strPassword	Mot de passe

(3) Exemple

```

Set WshNetwork = WScript.CreateObject("WScript.Network")
WshNetwork.MapNetworkDrive ("E:", "\\Server\Public")
WshNetwork.RemoveNetworkDrive ("E:");

```

h) RemoveNetWorkDrive*(1) Intérêt*

Enlève un lecteur mappé

(2) Syntaxe

```
object.RemoveNetworkDrive(strName, [bForce], [bUpdateProfile])
```

(3) Arguments

strName	Supprime le lecteur logique spécifié
bForce	Valeur logique qui force la suppression alors des utilisateurs sont connectés
bUpdateProfile	Si la valeur est à True, les modifications sont apportées au profil de l'utilisateur. La valeur par défaut est False.

(4) Exemple

```

Set WshNetwork = WScript.CreateObject("WScript.Network");
WshNetwork.MapNetworkDrive ("E:", "\\Server\Public")
WshNetwork.RemoveNetworkDrive ("E:");

```

i) ComputerName, UserName, UserDomain*(1) Remarque*

UserDomain n'est valable que sur Windows Nt/2000. Il reprend le contenu de la variable

(2) Exemple

```

'Donne le nom de la machine et le nom d'utilisateur
Set OBJ_WSH_NETWORK=CreateObject("Wscript.Network")
with OBJ_WSH_NETWORK
    Wscript.Echo .ComputerName & " | " & .UserName
end with

```

K. Objet WshControler

1. Condition

HKLM\Software\Microsoft\Windows Script Host\Settings\Remote to 1

2. La méthode CreateScript

a) Syntaxe

```
object.CreateScript(CommandLine,[MachineName])
```

b) Paramètres

CommandLine Chemin d'accès complet au script
MachineName Nom UNC de l'ordinateur distant

3. La méthode Execute

```
ObjetWshControler.Execute
```

4. La propriété Status

```
ObjetWshControler.Status
```

Valeur retournée	Sens	Description
0	NoTask	The remote script object has been created but has not yet executed.
1	Running	The remote script object is currently running.
2	Finished	The remote script object has finished running.

5. La propriété Error

```
ObjetWshControler.Error
```

6. La méthode Terminate

```
ObjetWshControler.Terminate
```

7. Les événements Error, Start, End

Ils sont définis par des procédures ayant le même préfixe :

```
Sub PROC_Error()
```

```
End Sub
```

```
Sub PROC_Start()
```

```
End Sub
```

```
Sub PROC_End()
```

```
End Sub
```

8. Exemple

```
Dim Controller, RemoteScript
Set Controller = WScript.CreateObject("WSHController")
Set RemoteScript = Controller.CreateScript("test.js", "remoteserver")
WScript.ConnectObject RemoteScript, "remote_"
RemoteScript.Execute
Do While RemoteScript.Status <> 2
    WScript.Sleep 100
Loop

Sub remote_Error
    Dim theError
    Set theError = RemoteScript.Error
    WScript.Echo "Error - Line: " & theError.Line & ", Char: " & theError.Character & vbCrLf & "Description: " &
theError.Description
```

```
WScript.Quit -1
End Sub
```

L. *Objet FileSystemObject*

1. Propriétés

AtEndOfLine	Returns true if the file pointer is positioned immediately before the end-of-line marker in a TextStream file; false if it is not.
AtEndOfStream	Returns true if the file pointer is at the end of a TextStream file; false if it is not.
Attributes	Sets or returns the attributes of files or folders.
AvailableSpace	Returns the amount of space available to a user on the specified drive or network share.
Column	Returns the column number of the current character position in a TextStream file.
CompareMode	Sets and returns the comparison mode for comparing string keys in a Dictionary object.
Count	Returns the number of items in a collection or Dictionary object.
DateCreated	Returns the date and time that the specified file or folder was created. Read-only.
DateLastAccessed	Returns the date and time that the specified file or folder was last accessed.
DateLastModified	Returns the date and time that the specified file or folder was last modified.
Drive	Returns the drive letter of the drive on which the specified file or folder resides.
DriveLetter	Returns the drive letter of a physical local drive or a network share.
Drives	Returns a Drives collection consisting of all Drive objects available on the local machine.
DriveType	Returns a value indicating the type of a specified drive.
Files	Returns a Files collection consisting of all File objects contained in the specified folder, including those with hidden and system file attributes set.
FileSystem	Returns the type of file system in use for the specified drive.
FreeSpace	Returns the amount of free space available to a user on the specified drive or network share.
IsReady	Returns true if the specified drive is ready; false if it is not.
IsRootFolder	Returns true if the specified folder is the root folder; false if it is not.
Item	Sets or returns an item for a specified key in a Dictionary object. For collections, returns an item based on the specified key.
Key	Sets a key in a Dictionary object.
Line	Returns the current line number in a TextStream file.
Name	Sets or returns the name of a specified file or folder.
ParentFolder	Returns the folder object for the parent of the specified file or folder.
Path	Returns the path for a specified file, folder, or drive.
RootFolder	Returns a Folder object representing the root folder of a specified drive.
SerialNumber	Returns the decimal serial number used to uniquely identify a disk volume.
ShareName	Returns the network share name for a specified drive.
ShortName	Returns the short name used by programs that require the earlier 8.3 naming convention.
ShortPath	Returns the short path used by programs that require the earlier 8.3 file naming convention.
Size	For files, returns the size, in bytes, of the specified file. For folders, returns the size, in bytes, of all files and subfolders contained in the folder.
SubFolders	Returns a Folders collection consisting of all folders contained in a specified folder, including those with hidden and system file attributes set.
TotalSize	Returns the total space, in bytes, of a drive or network share.
Type	Returns information about the type of a file or folder.
VolumeName	Sets or returns the volume name of the specified drive.

2. Les méthodes

Add	Adds a new folder to a Folders collection.
BuildPath	Appends a name to an existing path.
Close	Closes an open TextStream file.
Copy	Copies a specified file or folder from one location to another.
CopyFile	Copies one or more files from one location to another.
CopyFolder	Recursively copies a folder from one location to another.
CreateFolder	Creates a folder.
CreateTextFile	Creates a specified file name and returns a TextStream object that can be used to read from or write to the file.
Delete	Deletes a specified file or folder.
DeleteFile	Deletes a specified file.

DeleteFolder	Deletes a specified folder and its contents.
DrivesExists	Returns true if the specified drive exists; false if it does not.
Exists	Returns true if a specified key exists in the Dictionary object, false if it does not.
FileExists	Returns true if a specified file exists; false if it does not.
FolderExists	Returns true if a specified folder exists; false if it does not.
GetAbsolutePathName	Returns a complete and unambiguous path from a provided path specification.
GetBaseName	Returns a string containing the base name of the last component, less any file extension, in a path.
GetDrive	Returns a Drive object corresponding to the drive in a specified path.
GetDriveName	Returns a string containing the name of the drive for a specified path.
GetExtensionName	Returns a string containing the extension name for the last component in a path.
GetFile	Returns a File object corresponding to the file in a specified path.
GetFileName	Returns the last component of specified path that is not part of the drive specification.
GetFileVersion	Returns the version number of a specified file.
GetFolder	Returns a Folder object corresponding to the folder in a specified path.
GetParentFolderName	Returns a string containing the name of the parent folder of the last component in a specified path.
GetSpecialFolder	Returns the special folder object specified.
GetTempName	Returns a randomly generated temporary file or folder name that is useful for performing operations that require a temporary file or folder.
Items	Returns an array containing all the items in a Dictionary object.
Keys	Returns an array containing all existing keys in a Dictionary object.
Move	Moves a specified file or folder from one location to another.
MoveFile	Moves one or more files from one location to another.
MoveFolder	Moves one or more folders from one location to another.
OpenAsTextStream	Opens a specified file and returns a TextStream object that can be used to read from, write to, or append to the file.
OpenTextFile	Opens a specified file and returns a TextStream object that can be used to read from, write to, or append to the file.
Read	Reads a specified number of characters from a TextStream file and returns the resulting string.
ReadAll	Reads an entire TextStream file and returns the resulting string.
ReadLine	Reads an entire line (up to, but not including, the newline character) from a TextStream file and returns the resulting string.
Remove	Removes a key, item pair from a Dictionary object.
RemoveAll	Removes all key, item pairs from a Dictionary object.
Skip	Skips a specified number of characters when reading a TextStream file.
SkipLine	Skips the next line when reading a TextStream file.
Write	Writes a specified string to a TextStream file.
WriteBlankLines	Writes a specified number of newline characters to a TextStream file.
WriteLine	Writes a specified string and newline character to a TextStream file.

3. Collections

Drive	Provides access to the properties of a particular disk drive or network share.
File	Provides access to all the properties of a file.
FileSystemObject	Provides access to a computer's file system.
Folder	Provides access to all the properties of a folder.
TextStream	Facilitates sequential access to file.

4. Exemples

a) Exemple 1 : OpenTextFile et ReadAll

```
'Lecture du fichier boot.ini
Set OBJ_FSO=CreateObject("Scripting.FileSystemObject")
Set OBJ_FICHIER=OBJ_FSO.OpenTextFile("c:\boot.ini")
wscript.echo OBJ_FICHIER.ReadAll
```

b) Exemple 2 : DateLastAccessed

```
'Date de modification du fichier boot.ini
```

```
Set OBJ_FSO=CreateObject("Scripting.FileSystemObject")
Set OBJ_FICHIER=OBJ_FSO.GetFile("c:\boot.ini")
MsgBox OBJ_FICHIER.DateLastAccessed
```

c) Exemple 3 : Files et DateLastAccessed

```
'Liste des fichiers du répertoire racine
Set OBJ_FSO=CreateObject("Scripting.FileSystemObject")
Set OBJ_REP=OBJ_FSO.GetFolder("c:\")
Set OBJ_FICHIERS=OBJ_REP.Files
For Each OBJ_FICHIER in OBJ_FICHIERS
    V_LISTE=V_LISTE & Chr(13) & OBJ_FICHIER & Chr(9) & OBJ_FICHIER.DateLastAccessed
Next
WScript.Echo V_LISTE
```

d) Exemple 4 : OpenTextFile, ReadLine, AtEndOfStream

```
'Lecture du fichier boot.ini
Set OBJ_FSO=CreateObject("Scripting.FileSystemObject")
Set OBJ_FICHIER=OBJ_FSO.OpenTextFile("c:\boot.ini")
Do
    I=I+1
    v_LIGNE=OBJ_FICHIER.ReadLine
    V_AFFICHE = V_AFFICHE & Chr(13) & I & Chr(9) & v_LIGNE
Loop Until OBJ_FICHIER.AtEndOfStream
Wscript.Echo V_AFFICHE
```

M. Exécution automatique à l'aide des commutateurs de la commande CSCRIPT.EXE

Commande	Description
//B	Mode silencieux : supprime l'affichage des erreurs de scripts et des lignes de commande de demande d'information pour l'utilisateur.
//I	Mode interactif ; mode par défaut
//T :nn	Spécifie au bout de combien de secondes le script s'arrête. Par défaut, il n'y a pas de limite.
//logo	Affiche une bannière à l'exécution du script dans une fenêtre DOS
//nologo	N'affiche pas de bannière.
//?	Affiche l'aide sur les commandes
//H:Cscript ou Wscript	Spécifie Cscript ou Wscript comme l'application par défaut pour lancer des scripts.
//S	Enregistre les options de lancement pour l'utilisateur courant.
//E :<moteur>	Spécifie le moteur à utiliser
//X	Lance le programme dans le débogueur
//D	Active le débogueur
//Job :<JobID>	Lance le job spécifié dans le fichier .ws.

N. Les tableaux associatifs Scripting.Dictionary

```
<html>
<head>
<SCRIPT LANGUAGE = VBScript>
Set Temperatures = CreateObject("Scripting.Dictionary")
Temperatures.Add "Rouen", 23
Temperatures.Add "Toulouse", 28
Temperatures.Add "Nice", 31
If Not Temperatures.Exists("Paris") Then
    Temperatures.Add "Paris", 82
End If
If Temperatures.Exists("Rouen") Then
    Temperatures.Remove "Rouen"
```

```
    End If
    MsgBox Date()
</SCRIPT>

IV. WMI Windows Management Instrumentation

A. Définition

WMI est un ensemble de composants fournis depuis Windows NT4 (SP3) pour obtenir des informations sur votre machine et les machines Windows fonctionnant dans le réseau. Il fait partie intégrante de l'OS. Il s'agit de l'implémentation Microsoft Web-Based Enterprise Management (WBEM) proposée par le Desktop Management Task Force's (DMTF). Il s'agit d'une extension du standard CIM (Common Information Model) créé par le DMTF. La représentation est assurée par le CIM (Common Information Model). Si vous développez sur .Net, vous pouvez utiliser le composant System.Management.

B. Fournisseurs WMI

Fournisseur	DLL	Espace de nom	Description
Fournisseur Active Directory	dsprov.dll	root\directory\ldap	Établit la correspondance entre les objets Active Directory et WMI.
Fournisseur Event Log	ntevt.dll	root\cimv2	Gère les journaux d'événements Windows, par exemple, lit, sauvegarde, efface, copie, supprime, surveille, renomme, compresse, décompresse et modifie les paramètres des journaux d'événements.
Fournisseur Performance Counter	wbemperf.dll	root\cimv2	Donne accès aux données brutes de performance.
Fournisseur Registry	stdprov.dll	root\default	Lit, écrit, énumère, surveille, crée et supprime les clés et valeurs de bases de registres.
Fournisseur SNMP	snmpincl.dll	root\snmp	Donne accès aux données SNMP MIB et aux interruptions issues de périphériques gérés par SNMP.
Fournisseur WDM	wmiprov.dll	root\wmi	Donne accès aux informations sur les pilotes de périphériques WDM.
Fournisseur Win32	cimwin32.dll	root\cimv2	Donne des informations sur l'ordinateur, les disques, les périphériques, les fichiers, les dossiers, les systèmes de fichiers, les composants de mise en réseau, le système d'exploitation, les imprimantes, les processus, la sécurité, les services, les partages, les utilisateurs et groupes SAM et bien plus encore.
Fournisseur Windows Installer	msiprov.dll	root\cimv2	Donne accès aux informations sur le logiciel installé.

C. Installation

A partir de la ligne de commandes, veillez à ce que le service winmgmt (Infrastructure de Gestion Windows) soit exécuté :

```
Sc config winmgmt start= auto
Sc start winmgmt
```

D. Utilisation de la commande WMIC

1. Obtenir la liste des alias

ALIAS	Accès aux alias disponibles sur l'ordinateur local
BASEBOARD	Gestion de la carte de base (également appelée carte mère ou carte système).
BIOS	Gestion des services d'entrées/sorties (E/S) de base (BIOS).
BOOTCONFIG	Gestion de la configuration du démarrage.
CDROM	Gestion des CD-ROM.
COMPUTERSYSTEM	Gestion de systèmes informatiques.
CPU	Gestion de l'unité centrale.
CSPRODUCT	Informations sur l'ordinateur issues du SMBIOS.
DATAFILE	Gestion des fichiers de données. he ÉCHAP pour arrêter

DCOMAPP	Gestion d'applications.
DESKTOP	Gestion du Bureau de l'utilisateur.
DESKTOPMONITOR	Gestion du moniteur de bureau.
DEVICEMEMORYADDRESS	Gestion des adresses mémoire pour périphériques.
DISKDRIVE	Gestion des disques durs physiques.
DISKQUOTA	Gestion de l'utilisation de l'espace disque sur les volumes NTFS.
DMACHANNEL	Gestion du canal DMA (Accès direct à la mémoire).
ENVIRONMENT	Gestion des paramètres d'environnement système.
FSDIR	Gestion des entrées de répertoires du système de fichiers.
GROUP	Gestion des comptes de groupes.
IDECONTROLLER	Gestion de contrôleurs IDE.
IRO	Gestion des requêtes d'interruption (IRO).
JOB	Permet l'accès aux tâches planifiées à l'aide du service de planification.
LOADORDER	Gestion des services système définissant les dépendances d'exécution.
LOGICALDISK	Gestion des périphériques de stockage locaux.
LOGON	Sessions LOGON.
MEMCACHE	Gestion de la mémoire cache.
MEMLOGICAL	Gestion de la mémoire système (configuration, disposition et disponibilité de la mémoire).
MEMPHYSICAL	Gestion de la mémoire physique d'un ordinateur.
NETCLIENT	Gestion des clients réseau.
NETLOGIN	Gestion des informations d'ouverture de session réseau (d'un utilisateur précis).
NETPROTOCOL	Gestion des protocoles et de leurs caractéristiques réseau.
NETUSE	Gestion des connexion réseau actives.
NIC	Gestion des contrôleurs réseau NIC (Network Interface Controller).
NICCONFIG	Gestion des cartes réseau.
NTDOMAIN	Gestion de l'arborescence du domaine.
NTEVENT	Entrées dans le journal d'événements NT.
NTEVENTLOG	Gestion du fichier journal d'événements NT.
ONBOARDDEVICE	Gestion des périphériques carte communs intégrés dans la carte mère.
OS	Gestion des systèmes d'exploitation installés.
PAGEFILE	Gestion des paramètres du fichier d'échange de mémoire virtuelle.
PAGEFILESET	Gestion des paramètres de fichier d'échange.
PARTITION	Gestion des zones partitionnées d'un disque physique.
PORT	Gestion des ports d'E/S. ouche ÉCHAP pour arrêter
PORTCONNECTOR	Gestion des ports de connexion physique.
PRINTER	Gestion des périphériques d'impression.
PRINTERCONFIG	Gestion de la configuration des périphériques d'impression.
PRINTJOB	Gestion des tâches d'impression.
PROCESS	Gestion des processus.
PRODUCT	Gestion des tâches des packages d'installation.
QFE	Ingénierie de correctifs à chaud.
QUOTASETTING	Gestion des informations de quotas de disque sur un volume.
RECOVEROS	Informations recueillies en mémoire en cas de dysfonctionnement du système d'exploitation.
REGISTRY	Gestion du Registre système.
SCSICONTROLLER	Gestion de contrôleurs SCSI.
SERVER	Gestion des informations sur le serveur.
SERVICE	Gestion des applications de services.
SHARE	Gestion des ressources partagées.
SOFTWAREELEMENT	Gestion des éléments d'un logiciel installé sur un ordinateur.
SOFTWAREFEATURE	Gestion des logiciels sous-ensembles de SoftwareElement.
SOUNDDEV	Gestion des périphériques audio.
STARTUP	Gestion des commandes qui s'exécutent dès que l'utilisateur ouvre une session sur l'ordinateur
SYSACCOUNT	Gestion des comptes système.
SYSDRIVER	Gestion du pilote système pour un service de base.
SYSTEMENCLOSURE	Gestion de la mise en armoire du système.
SYSTEMSLOT	Gestion de des points de connexion physiques : ports, connecteurs et périphériques, et points

TAPEDRIVE	Gestion de lecteurs de bandes.
TEMPERATURE	Gestion d'un capteur de température (thermomètre électronique).
TIMEZONE	Gestion des données de fuseau horaire.
UPS	Gestion de l'alimentation de secours (UPS).
USERACCOUNT	Auditer la gestion des comptes.
VOLTAGE	Gestion des données de capteurs de tension (tensiomètre électronique).
VOLUMEQUOTASETING	Associe le paramètre de quota de disque à un volume précis.
WMISET	Gestion des paramètres opérationnels du service WMI.

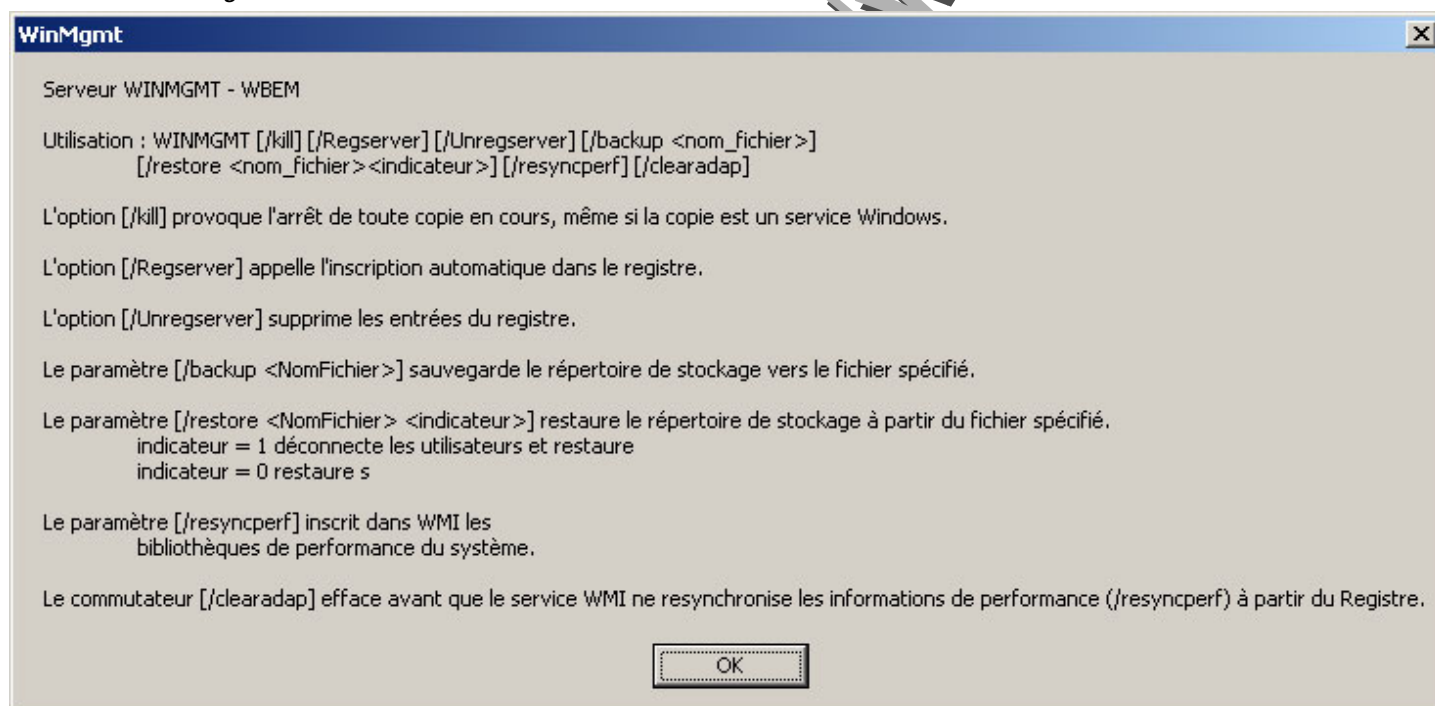

2. Exemples de commandes

```
WMIC PROCESS
WMIC PROCESS WHERE (Description="explorer.exe")
WMIC PROCESS GET /?
WMIC PROCESS GET Name, Handle, PageFaults
wmic SERVICE WHERE (Started=1) GET Name,Started
```

E. L'utilitaire Scriptomatic

Afin d'éviter à taper de fastidieuses lignes de code, vous pouvez télécharger l'utilitaire scriptomatic qui vous permettra par des opérations Copier/Coller à extraire les informations don't vous avez besoin pour votre application

F. Winmgmt : le service WMI

G. Une application complète

1. La base Access INVENTAIRE.MDB

2. Le script de connexion

```
Dim CHAINE_CONNECT,SQL,TEMP,DEBUT
DEBUT=Now
On Error Resume Next
Dim
O_SHELL,O_CONNECT,O_WMI,O_ELEMENTS,O_NETWORK,O_FSO,O_FICHER,ELEMENT,O_REP,O_REPS,O_FICHIERS,FICHER,REP

H. Autres Exemples

1. La liste des propriétés d'une classe (ListePropriétés.vbs)

```
Set objWMIService = GetObject("winmgmts:{impersonationLevel=impersonate}!\\" & strComputer & "\root\cimv2")
Set objClass = objWMIService.Get("Win32_BIOS")
PROPERTIES=""
For Each objProperty in objClass.properties_
    PROPERTIES=PROPERTIES & objProperty.name & Chr(10)
Next
WScript.Echo PROPERTIES
Set objClass = objWMIService.Get("Win32_GroupUser")
PROPERTIES=""
For Each objProperty in objClass.properties_
    PROPERTIES=PROPERTIES & objProperty.name & Chr(10)
Next
WScript.Echo PROPERTIES
```

2. Lancement et arrêt d'une application

a) Lancement

```
Option Explicit
Dim PROCESS,RES,PID
Set PROCESS=GetObject("winmgmts://.").Get("Win32_Process")
RES=PROCESS.Create("calc.exe",Null,Null,PID)
MsgBox "Processus n° : " & PID
Set PID=Nothing
Set RES=Nothing
Set PROCESS=Nothing
WScript.Quit
```

b) Arrêt

```
Option Explicit
Dim PROCESS
For Each PROCESS In GetObject("winmgmts://.").ExecQuery("SELECT * FROM Win32_Process WHERE Name='calc.exe'")
    PROCESS.Terminate(0)
Next
Set PROCESS=Nothing
```

3. Affiche la liste des processus

```
Dim FLAG
FLAG=true
For Each PROCESS in GetObject("winmgmts:{impersonationLevel=impersonate}").InstancesOf ("Win32_process")
'Variante : affiche la liste des processus sur une machine distante
' For Each PROCESS in GetObject("winmgmts:{impersonationLevel=impersonate}!//ServerName").InstancesOf
("Win32_process")
    If FLAG Then
        MESSAGE=PROCESS.Name
        FLAG=false
    Else
        MESSAGE=MESSAGE & Chr(10) & PROCESS.Name
    End If
Next
Wscript.Echo MESSAGE
```

4. La liste des services

```
'Nom donné à la machine courante
```

```

'strComputer = "."
,
strComputer = "."
,
'Création d'un objet Wmi
,
'Set objWMIService = GetObject("winmgmts:\\" & strComputer & "\root\cimv2")
,
'Création d'un fichier sur le disque contenant la liste des classes
,
Set Obj_Fso=CreateObject("Scripting.FileSystemObject")
Set OBJ_FICHIER=OBJ_FSO.CreateTextFile("e:\classeswmi.txt")
CLASSES=""
'For Each objclass in objWMIService.SubclassesOf()
'  CLASSES=CLASSES & objClass.Path_ & Chr(11)
'Next
'OBJ_FICHIER.Write CLASSES
,
'Fermeture et destruction des références au fichier
,
OBJ_FICHIER.Close
Set OBJ_FICHIER=Nothing
Set OBJ_FSO=Nothing
'wScript.echo CLASSES
,
'Chargement des éléments de la classe Win32_Service à l'aide du langage WQL
,
'Set collItems = objWMIService.ExecQuery("Select * from Win32_Service where State='Running'")
'Set collItems = GetObject("Winmgmts:").ExecQuery("Select * from Win32_Service")
,
'Autre méthode pour lire les éléments de la classe
,
Set wbemServices = GetObject("winmgmts:\\" & strComputer)
Set collItems = wbemServices.InstancesOf("Win32_Service")
'AFFICHE="Name" & Chr(9) & "State" & chr(13)
For Each objItem in collItems
  'AFFICHE=AFFICHE & objItem.Name & Chr(9) & objItem.State & chr(13)
  AFFICHE=AFFICHE & objItem.Name(0) & chr(13)
Next
wScript.echo AFFICHE

```

5. Autre exemple : la liste des services

```

Dim FLAG
FLAG=true
For Each SERVICE in GetObject("winmgmts:{impersonationLevel=impersonate}").InstancesOf ("Win32_service")
'Variante : affiche la liste des processus sur une machine distante
' For Each SERVICE in GetObject("winmgmts:{impersonationLevel=impersonate}!//ServerName").InstancesOf
("Win32_service")
,
  If FLAG Then
    MESSAGE=SERVICE.Name
    FLAG=false
  Else
    MESSAGE=MESSAGE & Chr(10) & SERVICE.Name
  End If
Next
Wscript.Echo MESSAGE

```

6. Affiche la mémoire

```
On Error Resume Next
Dim o_WMISERVICE,o_COLLECTION, o_ELEMENT, str_MESSAGE,str_ORDI,str_REQ
str_ORDI = "."
Set o_WMISERVICE= GetObject("winmgmts:\\." & str_ORDI & "\root\cimv2")
str_REQ = "Select TotalPhysicalMemory From Win32_LogicalMemoryConfiguration"
Set o_COLLECTION = o_WMISERVICE.ExecQuery(str_REQ)
For Each o_ELEMENT in o_COLLECTION
  If Err.Number Then
    Err.Clear
  Else
    If o_ELEMENT is nothing Then
      Exit For
    Else
      str_MESS = o_ELEMENT.TotalPhysicalMemory & " KB"
      Wscript.Echo str_MESS
    End If
  End If
End For
Next
```

7. Autre méthode : affichage de la mémoire

```
strComputer = "."
Set wbemServices = GetObject("winmgmts:\\." & strComputer)
Set wbemObjectSet = wbemServices.InstancesOf("Win32_LogicalMemoryConfiguration")
For Each wbemObject In wbemObjectSet
  MsgBox "Mémoire physique totale (ko): " & wbemObject.TotalPhysicalMemory
Next
```

15. Changement du mon associé à une lecteur logique

```
set disk = GetObject ("winmgmts:{impersonationLevel=impersonate}!//./root/cimv2:Win32_LogicalDisk=""C: """)
disk.VolumeName = "My C Drive"
disk.Put_
```

17. Autre exemple : afficher la mémoire vive

```
str_REQ = "Select TotalPhysicalMemory From Win32_LogicalMemoryConfiguration"
On Error Resume Next
Dim o_COLLECTION, o_ELEMENT, str_MESSAGE, o_SERVICE
Set o_COLLECTION = o_SERVICE.ExecQuery(str_REQ)
For Each o_ELEMENT in o_COLLECTION
  If Err.Number Then
    Err.Clear
  Else
    If o_ELEMENT is nothing Then
      Exit Sub
    Else
      str_MESS = Space(6) & o_ELEMENT.TotalPhysicalMemory & " KB"
      Wscript.Echo str_MESS
    End If
  End If
End For
Next
```

18. Autre exemple : affiche la liste des processus locaux

```
Set oCIM = GetObject("cim:")
for each Process in oCIM.CreateInstanceEnum("Win32_process")
  WScript.Echo Process.Name
Next
```

19. Affiche la liste des processus d'une machine distante

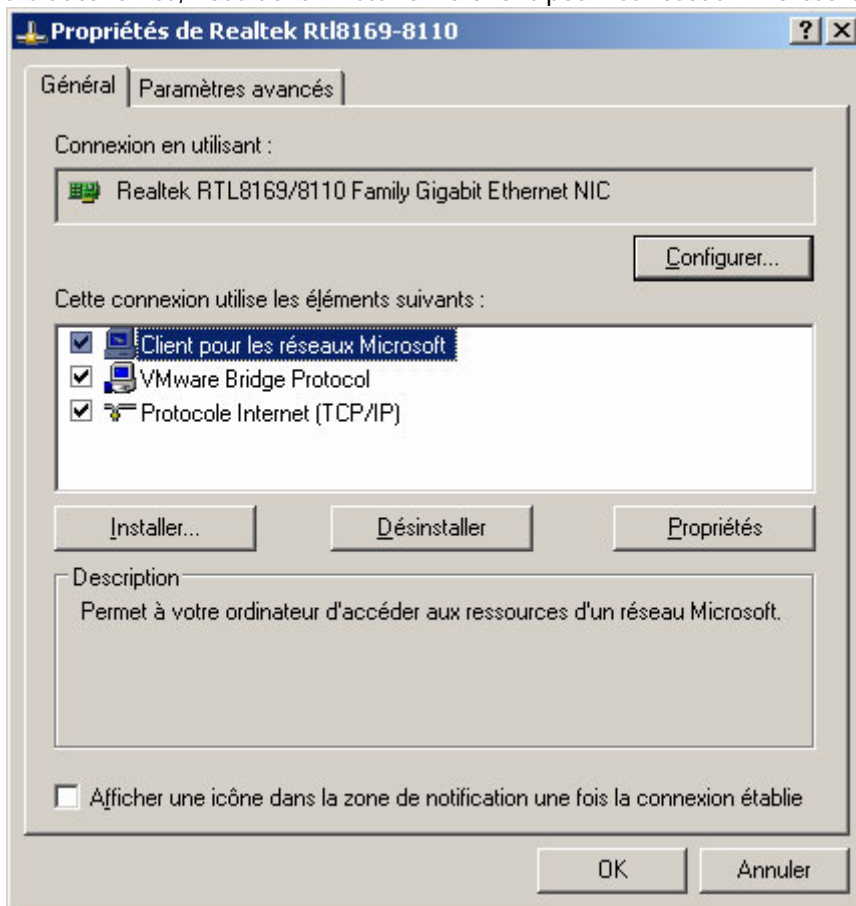

```
Set oCIM = GetObject("cim://marketing1")
for each Service in oCIM.CreateInstanceEnum("Win32_service")
    WScript.Echo Service.DisplayName
Next
```

Denis Szalkowski <http://www.dsfc.net>

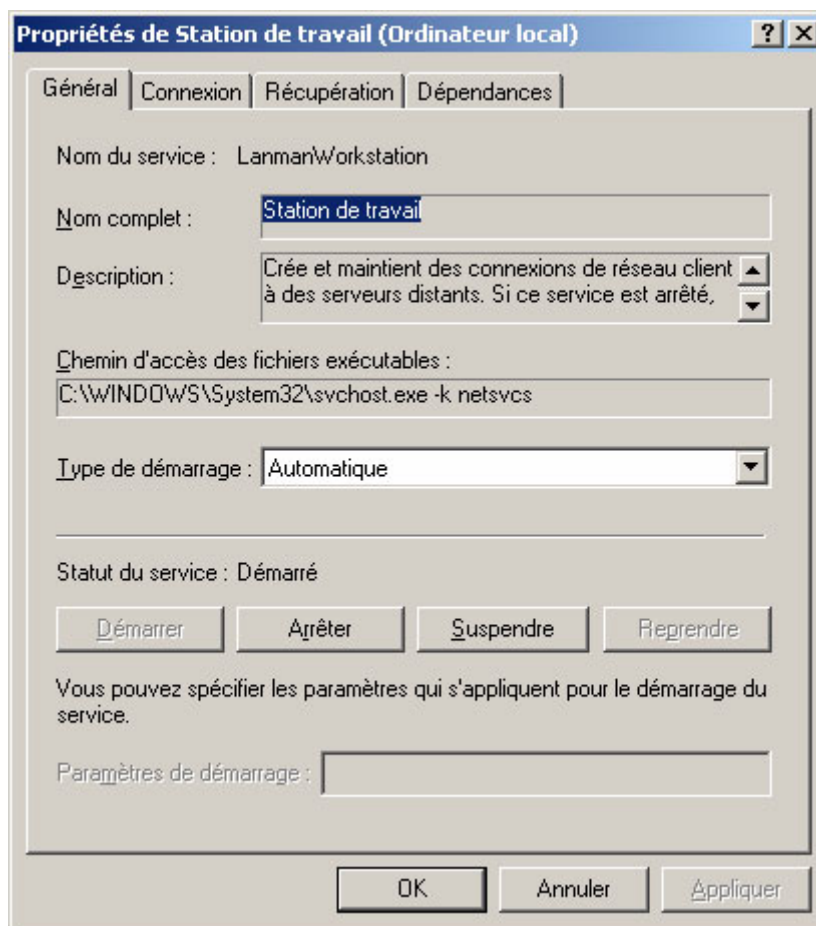

V. ADSI Active Directory Service Interfaces

A. Conditions d'utilisation de ADSI

Sur les stations et serveurs autonomes, vous devez installer le client pour les réseaux Microsoft :

Le service LanmanWorkStation doit être démarré :

B. Création d'un utilisateur sur une station de travail ou un serveur autonome

```
Option Explicit
Dim LOGIN,PWD,DOMAINE,UTILISATEUR
LOGIN=InputBox("Tapez le login :", "Login du nouvel utilisateur")
PWD=InputBox("Tapez le mot de passe :", "Mot de passe de l'utilisateur")
Set DOMAINE=GetObject("WinNT://.")
Set UTILISATEUR=DOMAINE.Create("USER", LOGIN)
UTILISATEUR.SetInfo
UTILISATEUR.SetPassword PWD
UTILISATEUR.SetInfo
Set UTILISATEUR=Nothing
Set DOMAINE=Nothing
WScript.Quit
```

C. Propriétés des utilisateurs

ADSI Property	Active Directory Property
AccountDisabled	userAccountControl Mask
AccountExpirationDate	accountExpires
BadLoginAddress	Not Supported
BadLoginCount	badPwdCount
Department	department
Description	description
Division	division
EmailAddress	mail
EmployeeID	employeeID
FaxNumber	facsimileTelephoneNumber

ADSI Property	Active Directory Property
FirstName	givenName
FullName	displayName
GraceLoginsAllowed	Not Supported
GraceLoginsRemaining	Not Supported
HomeDirectory	homeDirectory
HomePage	wwwHomePage
IsAccountLocked	userAccountControl
Languages	language
LastFailedLogin	badPasswordTime
LastLogin	lastLogon
LastLogoff	lastLogoff
LastName	sn
LoginHours	logonHours
LoginScript	scriptPath
LoginWorkstations	userWorkstations
Manager	manager
MaxLogins	Not Supported
MaxStorage	maxStorage
NamePrefix	personalTitle
NameSuffix	generationQualifier
OfficeLocations	physicalDeliveryOfficeName
OtherName	middleName
PasswordExpirationDate	Set using Group Policy Editor*
PasswordLastChanged	pwdLastSet
PasswordMinimumLength	Set using Group Policy Editor*
PasswordRequired	userAccountControl mask
Picture	thumbnailPhoto
PostalAddresses	postalAddress
PostalCodes	postalCode
Profile	profilePath
RequireUniquePassword	Set using Group Policy Editor*
SeeAlso	seeAlso
TelephoneHome	homePhone
TelephoneMobile	mobile
TelephoneNumber	telephoneNumber
TelephonePager	pager
Title	title

D. Interface Asp

1. La saisie d'un nouvel utilisateur : creation_user.html

```

<html>
<body>
  <form method="post" action="creation_user.asp">
    <table border="0">
      <tr>
        <td>Login</td>
        <td><input type="text" size="50" name="LOGIN"/></td>
      </tr>
    </table>
  </form>

```

```

    <tr>
      <td>Nom</td>
      <td><input type="text" size="50" name="NOM"/></td>
    </tr>
    <tr>
      <td>Pwd</td>
      <td><input type="password" size="50" name="PWD"/></td>
    </tr>
    <td><input type="submit" value="Ok"/></td>
    <td><input type="button" value="Retour" onclick="location.href='liste.asp'"></td>
  </table>
</form>
</body>
</html>

```

2. Le script Asp de Création de l'utilisateur : creation_user.asp

```

<%@ language="VBSCRIPT"%>
<%
Option Explicit
Dim LOGIN,NOM,PWD,DOMAINE,UTILISATEUR
LOGIN=Request.Form("LOGIN")
NOM=Request.Form("NOM")
PWD=Request.Form("PWD")
'Response.Write LOGIN & " " & NOM & " " & PWD
Set DOMAINE=GetObject("WinNT://.")
Set UTILISATEUR=DOMAINE.Create("USER",LOGIN)
UTILISATEUR.SetPassword PWD
UTILISATEUR.SetInfo
Set UTILISATEUR=Nothing
Set DOMAINE=Nothing
Response.Redirect("liste.asp")
%>

```

3. La liste des utilisateurs : liste.asp

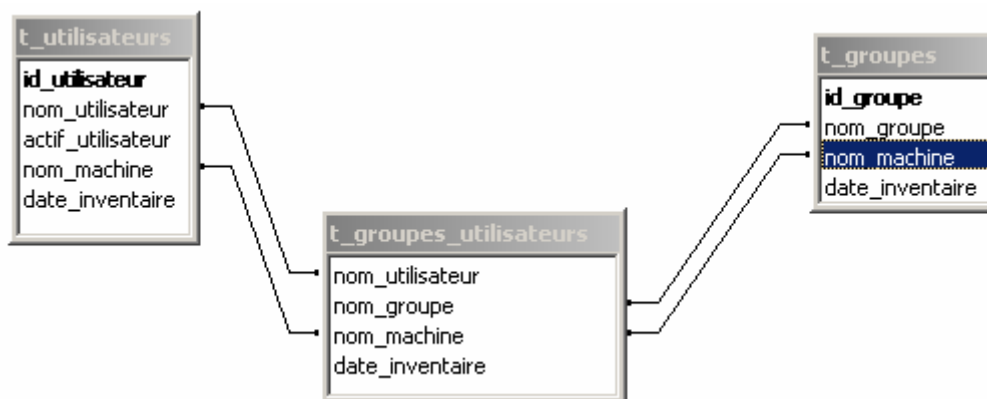

```

<%@ language="VBSCRIPT" %>
<html>
  <body>
    <%
      Dim DOMAIN,USER
      Set DOMAIN=GetObject("WinNT://.,computer")
      DOMAIN.Filter=Array("User")
      For Each USER In DOMAIN
        Response.Write (USER.Name & "<br/>")
      Next
      Set USER=Nothing
      Set DOMAIN=Nothing
    %>
  </body>
</html>

```

E. Une application consistant les utilisateurs et les groupes

1. La base de données

2. Le script

Option Explicit

```
Dim CONN,DSN,SQL
Set CONN=CreateObject("ADODB.Connection")
DSN="DRIVER={Microsoft Access Driver (*.mdb)};DBQ=" & "D:\SUPPORTS\WINDOWS\WshWmiAdsi\INVENTAIRE.mdb"
CONN.Open DSN
```

```

CONN.Execute(SQL)
SQL="DELETE FROM t_groupes WHERE nom_machine="" & COMPUTER & ""
CONN.Execute(SQL)
SQL="DELETE FROM t_groupes_utilisateurs WHERE nom_machine="" & COMPUTER & ""
CONN.Execute(SQL)
```

```
Dim DOMAINE,GROUPE,USER,ACTIF
Set DOMAINE= GetObject("WinNT://.")
```

```
DOMAINE.Filter = Array("User")
For Each USER In DOMAINE
  ACTIF=CBool(USER.AccountDisabled)
  If ACTIF=-1 Then
    ACTIF=0
  Else
    ACTIF=-1
  End If
  SQL="INSERT INTO t_utilisateurs(nom_utilisateur,actif_utilisateur,nom_machine,date_inventaire) " & _
  " VALUES(" & USER.Name & "," & ACTIF & "," & COMPUTER & "," & Now & ")"
  CONN.Execute(SQL)
Next
```

```
DOMAINE.Filter = Array("Group")
For Each GROUPE In DOMAINE
  SQL="INSERT INTO t_groupes(nom_groupe,nom_machine,date_inventaire) " & _
  " VALUES(" & GROUPE.Name & "," & COMPUTER & "," & Now & ")"
  CONN.Execute(SQL)
  For Each USER In GROUPE.Members
```

```
SQL="INSERT INTO t_groupes_utilisateurs(nom_utilisateur,nom_groupe,nom_machine,date_inventaire) " & _
" VALUES(" & USER.Name & "," & GROUPE.Name & "," & COMPUTER & "," & Now & ")"
CONN.Execute(SQL)
```

Next

Next

F. Les Chaînes de connexion

Fournisseur	Domaine
WinNT:	Permet l'administration de serveurs NT4 (PDC & BDC), de stations de travaux et de serveurs autonomes
LDAP:	S'appliquent aux serveurs LDAP et Active Directory
NDS:	Accès aux serveurs Netware disposant de l'annuaire NDS
NWCOMPAT:	Accès aux serveurs Netware

1. WinNT

Chemin	Intérêt
WinNT:	Connexion à l'espace de nom
WinNT://domaine	Connexion au domaine "domaine"
WinNT://domaine/polo,user	Connexion à l'utilisateur polo du domaine
WinNT://domaine/dc/informaticiens, group	Connexion au groupe des informaticiens du contrôleur de domaine dc appartenant au domaine
WinNT://serveur,computer	Connexion à la machine "serveur"

2. Ldap

Chemin	Signification
LDAP://dc	Connexion au contrôleur de domaine dc
LDAP://machine.domaine.com	Connexion au domaine
LDAP://exchsvr:390	Connexion à un serveur avec spécification du port
LDAP://server/cn=users,ou=info,dc=dsfc,dc=fr	Connexion à l'objet représentant la liste des utilisateurs

3. Exemples Ldap

a) Liste des objets d'une organisation (ListeOu.vbs)

```
Option Explicit
Dim OU, ELEMENT,MSG
Set OU=GetObject("LDAP://127.0.0.1:389/ou=info,dc=dsfc,dc=fr")
For ELEMENT In OU
    MSG=MSG & ELEMENT.Class & Chr(9) & ELEMENT.Name & Chr(13)
Next
Set ELEMENT=Nothing
Set OU=Nothing
```

b) Créer un utilisateur dans une organisation (CreationUsrOu.vbs)

```
Option Explicit
Dim OU, USER
Set OU=GetObject("LDAP://127.0.0.1:389/ou=info,dc=dsfc,dc=fr")
Set USER=OU.Create("User",cn=Essai)
With USER
    .Put "sAMAccountName","Essai"
    .Put "givenName","Roger"
    .Put "sn","Rabbit"
    .Put "description","Créature féroce"
    .Put "streetAddress","12 boulevard Hollywood"
```

```
.Put "l", "Paris"
.Put "st", "Ile de France"
.Put "postalCode", "75000"
.Put "telephoneNumber", "01.47.47.47"
.SetInfo
.SetPassword "Choucroute"
.AccountDisabled=False
.SetInfo
End With
Set USER=Nothing
Set OU=Nothing
```

```

H. Méthodes

1. Get

```
Dim MyUser as IADs
Dim MyCommonName as String

' Bind to a specific user object.
set MyUser = GetObject("LDAP://CN=JamesSmith,OU=MyOrgUnit")

' Get property
MyCommonName = MyUser.Get("CN")
```

```
Dim MyUser as IADs
Dim MyName as String
```

```
' Bind to a specific user object.
Set MyUser = GetObject("LDAP://MyMachine/CN=JamesSmith,DC=ArcadiaBay,DC=COM")
```

```
' Get property
MyName = MyUser.Name
```

```
Dim MyUser as IADs
Dim MyName as String
```

```
' Bind to a specific user object.
set MyUser = GetObject("LDAP://CN=JamesSmith,OU=MyOrgUnit")
```

```
' Get property
MyName = MyUser.Get("distinguishedName")
```

2. GetEx

```
Dim obj As IADs
Dim objList As Variant
```

```
Set obj = GetObject("LDAP://MyMachine/CN=Administrator,CN=Users,DC=ArcadiaBay,DC=com")
```

```
objList = obj.GetEx("description")
```

```
For Each Desc In objList
  ' Print the descriptions
  Debug.Print (Desc)
Next
```

3. GetInfo

```
Dim MyUser as IADsUser
'MyUser will be used to demonstrate implicit GetInfo
Dim MyUser2 as IADsUser
'Myuser2 will show the explicit GetInfo
```

```
' Bind to a specific user object.
set MyUser = GetObject("LDAP://MyMachine/CN=JamesSmith,DC=ArcadiaBay,DC=COM")
set MyUser2 = GetObject("LDAP://MyMachine/CN=JamesSmith2,DC=ArcadiaBay,DC=COM");
```

```
'Perform some time consuming operations.
```

```
'Code assumes that the property description has a single value in the directory
' Note that this will IMPLICITLY call GetInfo as at the point this call is made GetInfo
' has not yet been called (implicitly or explicitly) on the MyUser object.
Debug.print "MyUser's description value is "; MyUser.Get("Description")
```

```
'Since the GetInfo has already been called implicitly this call is satisfied from
' the value in the cache.
Debug.print "MyUser's sAMAccountName is "; MyUser.Get("sAMAccountName")
```

```
' Refresh the cache explicitly so the most current value is available
MyUser2.GetInfo
```

```
'Perform time consuming operations
```

```
'Note that this call is satisfied from the cache as GetInfo has already been called
'explicitly for this object.
```

```
Debug.print "MyUser2 has the description set to "; MyUser.Get("Description")
```

4. GetInfoEx

```
GetInfoEx
```

5. Put

```
Dim Namespace As IADsOpenDSObject
Dim User As IADsUser
Dim NewName As Variant
```

```
Set Namespace = GetObject("LDAP:")
```

```
Set User =
Namespace.OpenDSObject("LDAP://MyMachine/CN=Administrator,CN=Users,DC=MyDomain,DC=ArcadiaBay,DC=COM",
"Administrator", "", ADS_SECURE_AUTHENTICATION)
```

```
NewName = "James Smith"
```

```
' Set using IADs::PutMethod
User.Put "FullName", NewName
User.SetInfo
```

6. PutEx

```
Dim x As IADs
Set x = GetObject("LDAP://CN=Administrator,CN=Users,DC=ArcadiaBay,DC=com")
```

```
' Assume the otherHomePhoneNumber has the following values:
' 111-1111, 222-2222
```

```
x.PutEx ADS_PROPERTY_APPEND, "OtherhomePhone", Array("333-3333" )
x.SetInfo 'Now the values are 111-1111,222-222,333-3333
```

```
x.PutEx ADS_PROPERTY_DELETE, "OtherHomePhone", Array("111-1111", "222-2222")
x.SetInfo 'Now the values are 333-3333
```

```
x.PutEx ADS_PROPERTY_UPDATE, "OtherHomePhone", Array("888-8888", "999-9999")
x.SetInfo 'Now the values are 888-8888,999-9999
```

```
x.PutEx ADS_PROPERTY_CLEAR, "OtherHomePhone", vbNull
x.SetInfo 'Now the property has no value
```

I. Propriétés

```
Dim propList As IADsPropertyList
Dim propEntry As IADsPropertyEntry
Dim propValue As IADsPropertyValue
Dim rootDSE As IADs
```

```
'Get the rootDSE entry that contains configuration information
Set rootDSE = GetObject("LDAP://RootDSE")
```

```
'Bind to the domain
Set propList = GetObject("LDAP://" & rootDSE.Get("defaultNamingContext"))
```

```
'Get the Property Entries
```

```
Set propEntry = propList.GetPropertyItem("allowedChildClassesEffective", ADSTYPE_CASE_IGNORE_STRING)

```

```
' Retrieve the contents of the ntSecurityDescriptor field which is
'   an interface pointer on the security descriptor object
'   for the X object
Set SecurityDescriptor = X.Get("ntSecurityDescriptor")
' Print out the owner of the object
' Print out the group
Debug.Print SecurityDescriptor.Owner
Debug.Print SecurityDescriptor.Group
'
Set Dacl = SecurityDescriptor.DiscretionaryAcl
' Enumerate the ACEs in the Dacl, first printing out the count
Debug.Print Dacl.AceCount
```

```
For Each Obj In Dacl
    Debug.Print Obj.Trustee
    Debug.Print Obj.AccessMask
    Debug.Print Obj.AceFlags
    Debug.Print Obj.AceType
Next
```

L. Propriétés de LDAP://rootDSE ou LDAP://servername/rootDSE

Property	Description
currentTime	Current time set on this directory server.
subschemaSubentry	Distinguished name for the subSchema object. The subSchema object contains properties that expose the supported attributes (in the attributeTypes property) and classes (in the objectClasses property). The subschemaSubentry property and subschema are defined in LDAP 3.0 (see RFC 2251).
dsServiceName	The distinguished name of the NTDS settings object for this directory server.
namingContexts	Multi-valued. DISTINGUISHED NAMES for all naming contexts stored on this directory server. By default, a Windows 2000 domain controller contains at least three namespaces: Schema, Configuration, and one for the domain of which the server is a member.
defaultNamingContext	By default, the distinguished name for the domain of which this directory server is a member.
schemaNamingContext	Distinguished name for the schema container.
configurationNamingContext	Distinguished name for the configuration container.
RootDomainNamingContext	Distinguished name for the first domain in the forest that contains the domain of which this directory server is a member.
SupportedControl	Multi-valued. OIDs for extension controls supported by this directory server.
SupportedLDAPVersion	Multi-valued. LDAP versions (specified by major version number) supported by this directory server.
HighestCommittedUSN	Highest USN used on this directory server. Used by directory replication.
SupportedSASLMechanisms	Security mechanisms supported for SASL negotiation (see LDAP RFCs). By default, GSSAPI is supported.
DnsHostName	DNS address for this directory server.
LdapServiceName	Service Principal Name (SPN) for the LDAP server. Used for mutual authentication.
ServerName	Distinguished name for the server object for this directory server in the configuration container.

M. Connexions NDS

1. Connexion.

```
Dim dso
Dim obj
Dim usrName
Dim password
Dim serverName
```

```
servername = "ntmarst2"  
userName = "supervisor.ntmarst2"  
password = "secretpwd"
```

```
'--bind to the server  
Set dso = GetObject("NDS:")  
Set cont = dso.OpenDSObject("NDS://" & serverName,userName,password,0)
```

```
'--enumerate the server's objects  
For Each obj In cont  
    Debug.Print obj.Name & " (" & obj.Class & ")"  
Next
```

2. Propriétés d'un utilisateur

```
Path = "O=NTMARST2/CN=benny"  
ADsPath = "NDS://" & serverName & "/" & Path  
Set usr = dso.OpenDSObject(ADsPath, userName, password, 0)  
Debug.Print usr.Get("Surname")  
usr.Put "SurName", "Johnson"  
usr.SetInfo
```

3. Création d'un utilisateur

```
Path = "O=NTMARST2"  
ADsPath = "NDS://" & serverName & "/" & Path  
Set cont = dso.OpenDSObject(ADsPath, userName, password, 0)  
Set usr = cont.Create("user", "bagheeraw")  
usr.Put "cn", "Bagheera"  
usr.Put "Surname", "White"  
usr.SetInfo
```

4. Recherche d'un utilisateur

```
ADsPath = "NDS://" & serverName  
Set con = CreateObject("ADODB.Connection")  
con.Provider = "AdsDSOObject"  
con.Properties("User ID") = userName  
con.Properties("Password") = password  
con.Open "ADSI"
```

```
Set com = CreateObject("ADODB.Command")  
Set com.ActiveConnection = con  
com.CommandText = "SELECT ADsPath, 'Object Class' FROM " & ADsPath & " WHERE Surname='Bagheera'"  
Set rs = com.Execute
```

```
While Not (rs.EOF)  
    Debug.Print rs.Fields("ADsPath")  
    rs.MoveNext  
Wend
```

N. Connexion Netware

1. Tester une connexion à un serveur Netware

```
net use \\nwserver /U:mydom\jsmith
```

2. Exemple de Code

```
servername = "ntmarst2"  
adsPathName = "NWCOMPAT://" & serverName  
Set cont = GetObject(adsPathName)
```

```
'--enumerate the server's objects
For Each obj In cont
  Debug.Print obj.Name & " (" & obj.Class & ")"
Next
This example creates a new user with a username of "alicew".
```

```
adsPath = "NWCOMPAT://" & serverName
Set cont = GetObject(adsPath)
Set usr = cont.Create("user", "alicew")
usr.SetInfo
This example changes a particular user's full name to "Alice I. Wonderland".
```

```
objPath = "alicew,user"
adsPath = "NWCOMPAT://" & serverName & "/" & objPath
Set usr = GetObject(adsPath)
usr.FullName = "Alice I. Wonderland"
usr.SetInfo
Searching is not supported in NWCOMPAT. You can, however, use the IADsContainer::put_Filter method to limit the type of object classes to be included in the enumeration.
```

```
adsPath = "NWCOMPAT://" & serverName
Set con = GetObject(adsPath)
con.Filter = Array("user", "group") 'Show user and group
```

```
For Each acct In con
  Debug.Print acct.Name & " (" & acct.Class & ")"
Next
```
